

COOPER PRECISION REVERSION PROTOCOL

Official Strategy Rulebook Micro Futures Day Trading System

“Trade the boundaries. Respect the structure. Control the risk.”

Strategy Name	Cooper Precision Reversion Protocol (CPRP)
Creator / Owner	Raymon Michael Cooper
Version	1.6 — Multi-Timeframe Hierarchy & Order Flow Clarified
Original Creation	August 4, 2026
This Edition	August 12, 2026
Primary Instruments	MES (primary), MNQ, MYM
Style	Intraday Range / Channel Reversion (Not Scalping)

This document is the authoritative definition of the Cooper Precision Reversion Protocol. All trading decisions under this system must conform to the rules stated herein. Deviations void the integrity of the process and the performance record.

1. Strategy Overview

The Cooper Precision Reversion Protocol is a structured, rules-based **intraday mean-reversion / range strategy** designed exclusively for Micro E-mini futures. It identifies confirmed Support and Resistance ranges or channels (both sideways and trending) and systematically fades the boundaries until the structure is broken.

The protocol is directionally neutral: the same rules apply whether price is oscillating in a horizontal range or traveling inside a defined channel. The edge is derived from precise identification of structure, multi-factor confirmation, order-flow awareness, and absolute risk control.

Important: CPRP is **not** a scalping strategy. Holding periods are typically measured in minutes to a couple of hours. Do not force ultra-short holds or high-frequency entries when conditions are slow — step up in timeframe instead.

Core Philosophy

- Trade only confirmed structure — never anticipate.
- Fade the extremes of the range/channel until the structure fails.
- Multi-timeframe alignment + volume + price action + RSI + order flow must agree.
- Hard dollar risk limit on every trade. No exceptions.
- When structure breaks, step aside. Do not force trades.

- Respect higher-timeframe bias. Do not fight sustained buying or selling power.

2. Instruments & Chart Setup

Approved Instruments (Micro Futures Only)

- **MES** — Micro E-mini S&P; 500 (Primary)
- **MNQ** — Micro E-mini Nasdaq-100
- **MYM** — Micro E-mini Dow Jones

No other instruments are permitted under this protocol.

Multi-Timeframe Hierarchy (v1.6)

The system uses a clear hierarchy. Higher timeframes set the bias; lower timeframes locate levels and time entries.

Chart	Role	Purpose
60-minute (static)	Overall Bias / Sentiment	Long-term trend context. Does not generate entries. Determines which way you are allowed to lean.
30-min or 15-min	Structure & Levels	Identifies confirmed S/R zones and current swing structure. Your “map.”
15-min or 5-min	Timing & Pressure	Entry timing, rejection quality, and order-flow confirmation (bids vs asks). Your “trigger.”

Approved Working Pairs (v1.6)

Only two working pairs are approved. Select based on **time of day, volume, and range size**.

Pair	When to Use	Notes
15m + 5m (Primary / Default)	Normal volume, clean ranges, active session hours	15m = structure & levels 5m = timing + pressure
30m + 15m (Secondary)	Early pre-market, low volume, lunch/slow periods, wider or choppy ranges	30m = structure & levels 15m = timing + pressure 5m only for fine-tuning entries

No chart lower than the 5-minute is used for structure or execution decisions. The former 5m+1m pair remains fully retired.

Static 60-Minute Chart (Mandatory)

Always keep a static **1-Hour (60-minute)** chart open in a separate window (4-Hour is an acceptable alternative). This chart provides overall bias and major levels. It does **not** generate entries.

- When the 60m is cleanly trending and elevated (strong buying/selling power), be selective fading against it.
- When the 60m is ranging or losing structure, standard reversion setups on the working pair generally improve in quality.

3. Structure Definition – Ranges & Channels

A valid trading environment exists only when a clear Support/Resistance range or channel has been confirmed. Both horizontal ranges and sloping channels are valid.

Confirmation Requirements

- At least two clear touches (or near-touches) at both the upper and lower boundary.

- Price action shows respect for the boundaries (rejection wicks, volume spikes, or clear turns).
- The structure is visible and unambiguous on the higher timeframe of the chosen pair.
- Trend / Channel direction is noted but does not change the fade logic.

Once structure is confirmed: **Upper boundary = Resistance (sell zone) • Lower boundary = Support (buy zone).**

New Session Highs / Developing Structure (v1.6)

When the market continues to push **new session highs** (or lows), previous session highs and lows lose relevance. Shift to the **current developing market structure**:

- New swing highs that are forming
- Higher lows that are holding on pullbacks
- Any short-term range or channel developing inside the larger move

Do not fade a new high solely because it is “new.” Trade the structure that is actively forming. Only when price stops making new highs and breaks its current higher-low structure do you treat the bias as potentially changing.

4. Order Flow – Buying Power vs Selling Power (v1.6)

Order flow is a core confirmation layer. Use it on the execution timeframe of your working pair.

- **Bid = Buying Power** (demand side)
- **Ask = Selling Power** (supply side)

When asks are heavier or more aggressive than bids, selling pressure dominates and price tends to move lower. When bids are heavier or more aggressive, buying pressure dominates and price tends to move higher.

A shift from bid-side dominance to ask-side dominance (or vice versa) at a key level is one of the strongest confirmations that a boundary is holding or breaking.

5. Entry Rules

Long Entries (Buy Support)

1. Price approaches or tags the confirmed lower boundary (Support).
2. Price action shows rejection (wick, engulfing, or clear reversal candle on the lower timeframe).
3. Volume supports the rejection or shows absorption.
4. Order flow shows bids defending (buying power present).
5. RSI condition is favorable (see RSI Guidance below).
6. All factors align → enter long with defined risk.

Short Entries (Sell Resistance)

1. Price approaches or tags the confirmed upper boundary (Resistance).
2. Price action shows rejection at the boundary.
3. Volume supports the rejection.
4. Order flow shows asks becoming aggressive (selling power present).
5. RSI condition is favorable (see RSI Guidance below).
6. All factors align → enter short with defined risk.

Important: Entries are only taken when the full confluence is present. Missing one required confirmation = no trade.

RSI Guidance (Updated v1.6)

RSI is **secondary confirmation**. Prefer divergence at the actual Support or Resistance level over absolute 70/30 extremes.

An elevated (overbought) RSI that **stays elevated** often simply reflects **persistent strong buying power**. In a market that keeps making new highs with sustained bid-side pressure, RSI can remain in overbought territory for an extended period. Do not fade solely because the reading is high.

Treat overbought as a potential exhaustion signal only when you also see confirmation that buying power is fading: structure break (loss of higher lows), shift to ask-side pressure, and/or RSI breaking back below the overbought threshold and failing to reclaim it. The same logic applies in reverse for oversold conditions.

On the structure chart (15m or 30m), RSI extremes are useful as alerts / preparation signals. If price is still mid-range, do not enter — wait for price to reach a confirmed boundary plus supporting price action, volume, and order flow. Optional: a faster RSI (period 7 or 9) may be shown on the execution chart purely for divergence visualization. The structure chart retains the standard 14-period RSI.

Confirming a Potential Change in 60m Bias

When the 60m is strong, look on the working pair for early cracks before treating the higher-timeframe bias as changing:

- 15m (or 30m) loses its higher-low (or lower-high) structure
- Clear shift to the opposite side of the order book (bids thinning / asks aggressive, or vice versa)
- RSI on the structure chart breaks the extreme and fails to recover
- Strong rejection quality (wicks + volume) against the prior direction

Require at least structure break + order-flow shift before treating the 60m bias as reversed. A small pullback with bids still defending is usually just noise inside the larger trend.

6. Risk Management & Exits

Hard Risk Rule (Non-Negotiable)

Every trade must have a hard maximum loss of **–\$50 to –\$100** per contract (or per position). Exit immediately if this threshold is reached. No averaging down. No “hope.”

Profit Taking & Trade Management

- Primary target is the opposite boundary of the current range/channel.
- Partial profits may be taken at logical intermediate levels or midpoint of the range.
- Trail stops only after the trade has moved meaningfully in favor and structure remains intact.
- If the opposite boundary is reached with strength, consider full exit or scale-out.

Structure Break Rule

When price closes decisively beyond a confirmed boundary (Support or Resistance broken with conviction), the current structure is invalidated. Immediately:

- Flatten any open position related to that structure (if not already stopped).
- Pause all new trading for a minimum of 30 minutes or until a new clear structure forms.
- Do not force trades during the transition period.

7. Pre-Trade Confirmation Checklist

Before every entry, verify each item. If any item fails, stand aside.

1	Clear, confirmed S/R range or channel on the higher TF of the working pair
2	Price is at or near the boundary (Support for long / Resistance for short)
3	Price action rejection visible on the lower TF of the working pair
4	Volume supports the rejection / absorption

5	Order flow confirms (bids defending for longs / asks aggressive for shorts)
6	RSI condition is favorable (not opposing extreme; divergence preferred at the level)
7	Hard stop distance fits within –\$50 to –\$100 risk limit
8	No recent structure break (or 30-min pause has completed)
9	60m bias is not strongly opposing the intended trade (or you are being highly selective)

8. Operational Discipline

- Trade only during periods of reasonable liquidity for the chosen micro contract.
- Prefer MES as the primary instrument; use MNQ or MYM only when conditions are clearly superior.
- In early pre-market or low-volume conditions, default to the 30m+15m pair.
- Maintain a complete trade journal for every execution (entry reason, checklist status, outcome, lessons).
- Review performance weekly against these rules. Strategy integrity > short-term P&L.;
- Never increase risk beyond the hard dollar limit to “make up” losses.
- Do not switch into scalping mode when the market is slow — step up the timeframe and take fewer, higher-quality trades.
- The Protocol is complete as written. Additional indicators or discretionary overrides are not part of the system.

9. Version History

Ver	Date	Changes
1.0	Aug 4, 2026	Initial formalization of Micro Range Reversion Strategy rules.
1.1	Aug 5, 2026	Minor clarifications to structure confirmation and risk language.
1.2	Aug 8, 2026	Official rename to Cooper Precision Reversion Protocol. Branding alignment.
1.3	Aug 9, 2026	Added official guidance on static 1-Hour chart for long-term trend context.
1.5	Aug 10, 2026	Chart-pair hierarchy locked (15m+5m default, 30m+15m secondary). 5m+1m fully retired. RSI clarified as secondary confirmation.
1.6	Aug 12, 2026	Multi-timeframe hierarchy formalized (60m bias → structure → timing). Order-flow (Bid/Ask power) added. RSI elevated = potential strength clarified. New-session-highs / developing structure guidance added. Explicit “not scalping” classification. Pre-market pair guidance and expanded checklist.

Disclaimer: Futures trading involves substantial risk of loss and is not suitable for all investors. This rulebook defines a personal trading protocol. It does not constitute investment advice, a solicitation, or a recommendation. Past performance is not indicative of future results. The creator accepts no liability for trading decisions made by others using these rules.
