

CPRP SCALPING

1-Minute Keltner Mean-Reversion Protocol

Official Strategy Rulebook

Secondary Scalping Tool for Quiet / Sideways Conditions

“Fade the extremes only when the market is quiet.”

Strategy Name	CPRP Scalping (Secondary to Cooper Precision Reversion Protocol)
Creator / Owner	Raymon Michael Cooper
Version	1.1
This Edition	August 12, 2026
Primary Instruments	MES (primary), MNQ, MYM
Style	1-Minute Mean-Reversion Scalping
Best Environment	Sideways accumulation / quiet range-bound conditions

This document defines the official rules for CPRP Scalping — a secondary, discretionary scalping tool used only when the primary Cooper Precision Reversion Protocol (CPRP) is quiet. It is not a replacement for CPRP and must never be used during strong directional trends.

1. Strategy Overview

CPRP Scalping is a pure 1-minute mean-reversion strategy that fades the outer bands of the Keltner Channel using the SMA(14) as a dynamic midline. It is designed exclusively for quiet, sideways, or accumulation environments where higher-timeframe structure is unclear or inactive.

Best environment: Sideways accumulation / tight range-bound price action with repeated respect for the Keltner extremes and clear acceptance on one side of the SMA.

Core Philosophy

- Only trade when primary CPRP conditions are quiet.
- Fade extremes only when price is clearly living on one side of the SMA.
- Require repeated, respectful touches of the outer Keltner band.
- Keep risk very small — this is scalping, not range trading.
- Stand aside immediately if a strong directional move develops.

2. Relationship to Primary CPRP

CPRP remains the primary system. CPRP Scalping is strictly secondary and may only be used when:

- No clean, high-quality Support/Resistance range or channel exists on the 15+5 or 30+15 pair.
- The 60-minute bias is neutral or the market is in clear sideways accumulation.
- Volume and volatility are subdued (typical of lunch, late session, or pre-market grind).

If a valid CPRP setup appears, abandon any open scalps and return to the primary protocol.

3. Chart & Indicator Setup

Element	Setting
Timeframe	1-minute only
Keltner Channel	NinjaTrader default settings
SMA (Midline)	Period 14
RSI	Period 14 • Overbought 80 • Oversold 20
Instruments	MES (primary), MNQ, MYM

The SMA(14) acts as the dynamic midline that divides the channel into an upper half and a lower half. You may only trade in the direction that fades the extreme on the side where price is currently accepted.

4. Entry Rules

Long Setup (Lower Half of Channel)

- Price is clearly trading below the SMA(14).
- Repeated, respectful touches of the lower Keltner band (price does not sustain a break).
- RSI is near or below 20, or turning higher from oversold territory.
- Enter long near the lower Keltner band.
- Primary target = SMA(14).
- Stop = SMA(14) or the Upper Keltner Band (whichever is selected for the trade).

Short Setup (Upper Half of Channel)

- Price is clearly trading above the SMA(14).
- Repeated, respectful touches of the upper Keltner band.
- RSI is near or above 80, or turning lower from overbought territory.
- Enter short near the upper Keltner band.
- Primary target = SMA(14).
- Stop = SMA(14) or the Lower Keltner Band (whichever is selected for the trade).

Only take the trade when the market is in sideways accumulation and the band is being respected. If price is chopping back and forth through the SMA, stand aside.

5. Risk Management & Exits

Recommended maximum loss per scalp: **\$30 – \$50** on micros. Keep risk very tight. No averaging down.

Exit Rules

- Primary target reached (SMA).
- Stop level hit (SMA or opposite Keltner band).
- Price breaks the outer band with strong momentum → exit immediately.
- A valid primary CPRP setup appears → flatten and switch back to CPRP.

6. Mandatory Stand-Aside Conditions

- Strong directional trend visible on the 15-minute or 60-minute chart.
- Price repeatedly crossing back and forth through the SMA with no clear acceptance on one side.
- Major economic news or data release (especially within 15–30 minutes).
- Extremely low or dead volume.
- Any time a high-quality CPRP range/channel setup is present.

7. Pre-Trade Checklist

All items must be true before entry:

1	Primary CPRP is quiet (no clean high-quality range on 15+5 / 30+15)
2	Market is in sideways accumulation or tight range-bound action
3	Price is clearly accepted on one side of the SMA(14)
4	Repeated respectful touches of the outer Keltner band
5	RSI confirms stretch (near 80 or 20) or is turning from extreme
6	Risk fits within \$30–\$50 maximum
7	No strong opposing trend on 15m or 60m
8	No major news imminent

8. Version History

v1.0 – 12 Aug 2026 – Initial formalization of 1-minute Keltner scalp rules.

v1.1 – 12 Aug 2026 – Named CPRP Scalping. Added sideways accumulation preference. Finalized stop rules (SMA or opposite Keltner band). Created official documents.
